                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-log ca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New mammalian cytokinin-like receptor Zcytor5 - useful for, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                   02-0CT-1998 (first entry)

                haematopoletin receptor superfamily, used in the method of the invention for the modulation of cell proliferation, or the immune response. Transformed mammalian cells are used to produce recombinant U4 protein. The U4 protein is used to screen for specific binding agents, raise antibodies. It is also used as reagents for assays and as tissue markers for isolation of cognate ligands and receptors, and in pharmaceutical compositions which may modulate cell proliferation, cell differentiation, and the immune system (e.g. for treating immune deficiency, inherited or the result of infection, autoimmune diseases,
                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding U4 haematopoletin receptor superfamily chain - potentially useful, e.g. for modulating cell proliferation or immune response, for treating cancer and auto:immune disease claim 9; Pagees 29-30; algop; English.

This is the amino acid sequence of the human U4 protein from the haematopoletin receptor superfamily, used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (GEMY) GENETICS INST INC

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of differentiation cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; U4 protein; haematopoietin receptor cell proliferation; immune response; antibo autoimmune disease; cancer; allergy.

        The present sequence represents a Zcytor5 variant protein. Zcytor5 is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 igands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05-NOV-1998;

Zcytor5 is a Cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim

                                        The present sequence represents a Zcytor5 variant protein. Zcytor5 is a cytokini-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart
 blood, and to discover other possible Zcytor5 ligands. comprising Zcytor5 DNA or RNA can be used to determine
                          of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the

Zcytor5 could be used to detect cardiotrophin-1 in blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the pres and integrity of the Zcytor5 gene on chromosome 19. Antibodies anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.

                                                                                                                                                    down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zeytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zeytor5 ligands. A probe comprising Zeytor5 NA or RNA can be used to determine the presence and integrity of the Zeytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zeytor5 ligand effects.

Claim 1; Page 99-100; 55pp; English.

Claim 1; Page 99-100; 55pp; English.

Che present sequence represents a Zcytor5 wariant protein. Zcytor5

Claim 2; Page 99-100; 55pp; English.

Chyrolidin present sequence represents a Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in the control of cardiotrophin-1 on cardiac pathologies, so preventing heart confirmed protects could be used to detect cardiotrophin-1 in the enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to deternine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the thorse anti-idiotypic antibody could be used to purify Zcytor5 and the the presence anti-idiotypic antibody could be used to purify Zcytor5 and the the presence anti-idiotypic antibody could be used to purify Zcytor5 and the the presence anti-idiotypic antibody could be used to purify Zcytor5 and the the presence anti-idiotypic antibody zcytor5 ligand effects.
                                                                                B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š

Scoring table: BLOSUM62

Searched: 122810 seqs, 40065486 residues

Database : PIR_60:* p1r2:* p1r3:* p1r4:* pirl:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lesi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: SIGNAL-TRANSDUCING MOLECULE. THE RECEPTOR SYSTEM IL-6, LIF, OSM, CNTF, AND IL-11 CAN UTILIZE GP130 FOR INIT SIGNAL TRANSMISSION. BINDS TO IL-6/IL-6-R (ALPHA CHAIN) CORESULTING IN THE FORWATION OF HIGH-AFFINITY IL-6 BINDING AND TRANSDUCES THE SIGNAL DOES NOT BIND IL-6. MAY HAVE A EMBRYONIC DEVELOPMENT (BY SIMILARITY).

SUBCULTURAL DOCATION: TYPE I MEMBRANE PROTEIN.

TISSUE SPECIFICITY: FOUND IN HEPATOCYTES, ASTROCYTES, FIB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           European Bioinformatics Institute.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SIMILARITY: CONTAINS 5 FIBRONECTIN TYPE III-LIKE DOMAINS.
